## Executive Summary

This is a report on the meeting held 8 - 10 November 2011 in Changsha, China to update the analysis of the *ex situ* population of giant pandas and develop breeding recommendations for the 2012 breeding season. This is the tenth annual set of genetic management recommendations developed for giant pandas.

The current *ex situ* population of giant pandas consists of 333 animals (151 males, 180 females, 2 unsexed pandas) located in 54 institutions worldwide. In 2011 there were 25 births and 8 deaths.

The genetic status of the population is currently healthy, with 50 founders represented and another 15 that could be genetically represented if they were to successfully breed. There are only 5 inbred animals with inbreeding coefficients  $> 3\%$  in the population.

There are 60 giant pandas in the studbook with unknown or uncertain sires. Most of these are pandas that were born in 2006 or later. The result is that 12% of the gene pool of the *ex situ* population is derived from uncertain ancestry.

**Molecular genetic analyses must continue to be used to confirm the parentage of these pandas as well as each year's new cubs before the next set of genetic management recommendations is made.** This report contains the list of giant pandas that need to have their paternity verified (see page 12). Plans should continue to resolve as many of these uncertainties within the next year as possible.

Population growth in 2011 was 5%, lower than the average of over 11% for the past six years. The slower growth was the result of focusing on breeding primarily the genetically valuable animals, rather than all animals.

The current population goal for the giant panda *ex situ* population is **to maintain a target population of 400-600 giant pandas that retains at least 90% gene diversity of the wild population for 200 years.** A population of this size and genetic composition should be able to provide animals for reintroduction efforts if needed in the future.

## ***Ex Situ* Giant Panda Management Program**

### Introduction

This is a report on the meeting held 8 - 10 November 2011 in Changsha, China to update the analysis and breeding plan of the *ex situ* population of giant pandas. Workshop participants updated the studbook and identified the females to be bred, and the males to which they should breed in 2012. The meeting was organized by the Chinese Association of Zoological Gardens (CAZG), and facilitated by the IUCN Conservation Breeding Specialist Group (CBSG).

The goals of the technical workshop were to:

- update the studbook with reports from all participating institutions;
- update the demographic and genetic analyses of the *ex situ* population; and
- formulate recommendations for breeding and management to promote these goals.

### Population Goals

In 2009 the Technical Committee revised the program goal to maintain at least 90% gene diversity for 200 years with a target population size of approximately 500 (400-600) giant pandas. A longer timeline was adopted due to the uncertainty surrounding the possible significant threats of climate change and habitat destruction. The rate of growth toward this new target size can be slowed, and increased effort will be placed in genetic management and natural reproductive and parental behaviors. Genetic management is the most effective method of maintaining a genetically viable *ex situ* population capable of supporting a wild panda population. The current population of 333 giant pandas needs to increase by 167 to reach the goal of 500 pandas (Figure 1).

Figure 1. Growth of the *ex situ* giant panda population from 2000 to 2011.

## Status of Captive Population

### Data Analysis and Pedigree Assumptions

Data were taken from the 6 November 2011 version of the *International Giant Panda Studbook* compiled by Xie Zhong, CAZG, using the ISIS Single Population Analysis and Record Keeping System (SPARKS) v1.6 software program. An analytical studbook (see below) was created in SPARKS v1.6, and PMx v1.0 software (Ballou, Lacy and Pollak) was used to conduct both demographic and genetic analyses (see Appendix B for more information). Data were current through the day of the workshop, as the studbook was updated during the workshop by institutional representatives.

Paternity is uncertain for many animals in the studbook. For many of these cases, females were first mated naturally and were then artificially inseminated. In others, lack of record-keeping in the early studbook years resulted in uncertainty about which males sired which cubs. Although molecular analyses have successfully identified the paternity of many pandas, there are still 60 pandas with uncertain paternity that affect the living gene pool, many of which were born between 2006 and 2011 (listed in Appendix B). The uncertain paternity of these 60 individuals results in 12% of the living gene pool being unknown.

SPARKS v1.6 includes the option to list the studbook numbers of the potential sires along with the probability of each of them being the real sire. These uncertain sires can then be exported to PMx, where the pedigree analysis will take into consideration the uncertainties and calculate the kinships based on the estimated paternity across the uncertain sires (see Lacy *et al.* 2011 for the methods).

While the ability to include such uncertainty in the analyses are useful, and even necessary to proceed with developing breeding recommendations, the genetic analyses for this *ex situ* population will not be completely accurate until the paternities are known for certain through molecular genetic analyses.

**Molecular analyses are needed to resolve the paternity of these 60 pandas as soon as possible since genetic management recommendations will not be accurate with these unknowns in the pedigree.**

## Demographic Status

The current *ex situ* population of giant pandas consists of 333 animals (151 males, 180 females, 2 unsexed pandas) located in 54 institutions worldwide. In 2011 there were 25 births and 8 deaths.

Reproduction over the last several years has resulted in an annual population increase of 9-15% for 2005 to 2010. In 2011 the growth rate was lower (5% increase) – presumably due to the increased focus on producing genetically valuable animals rather than large numbers. The age structure of the living population is healthy and indicative of a population that would be expected to continue to grow (Figure 2). A greater proportion of adult pandas have reproduced, especially females (from 41% in 2002 to 61% in 2011), which contributes positively to growth as well as the effective population size ( $N_e$ ) ( $N_e/N$  increased from 0.22 in 2002 to 0.27 by 2011).

Females are generally reproductive from 5-20 years of age, while male fertility can continue into the 20s. Generation time for the population is 10.9 years. Litters consist of 1-2 cubs with almost equal frequency (two litters of triplets have been observed), producing a mean litter size of 1.5 cubs. About 50% of males survive to age 14, 25% survive to age 19, and only about 10% survive to age 29; female survivorship is slightly better, with about 50% reaching age 17, 25% surviving to age 23, and 10% surviving to age 31. These values include wild-caught pandas whose ages are estimated.

Figure 2. Age and sex structure of the 2011 population. Dark blue are breeding age individuals; light blue are immature (at bottom) or post-reproductive (at top) pandas; yellow are the two unsexed individuals.

## Genetic Status

The *ex situ* giant panda population has descended from 50 wild-acquired founders (founders are defined as animals caught in the wild that have successfully produced offspring or descendants in the current population). There are an additional 15 wild-acquired pandas that have yet to produce living offspring but have not been excluded due to age or poor health (these are potential founders). The population theoretically contains 97.3% of the genetic diversity of the wild population. This level of genetic diversity has a founder genome equivalent (*FGE*) of 18.2, which means that the population has the same level of genetic diversity as a population newly established with 18 unrelated founders. The genetic contribution of founders is highly skewed, with 27% of the gene pool derived from only 4 founders (Figure 3). The level of genetic diversity in the population could be increased to 99% if the population was ideally managed and the genes from the additional 15 founders fully incorporated into the population. The population would then have a founder genome equivalent of 55.9 (Table 1). Managing the population to minimize average kinship has been shown to be the optimal method for retaining genetic diversity in the population. Managing by mean kinship will automatically identify descendants from the under-represented founders as priority breeders.

Table 1. Genetic summary of the 2011 *ex situ* population.

# Founders	50
# Potential (additional)	15
Gene Diversity Retained	0.9726
Potential Gene Diversity Retained	0.9911
Gene Value	0.9723
Founder Genome Equivalents ( <i>FGE</i> )	18.24
Potential <i>FGE</i>	55.95
Mean Inbreeding	0.0015

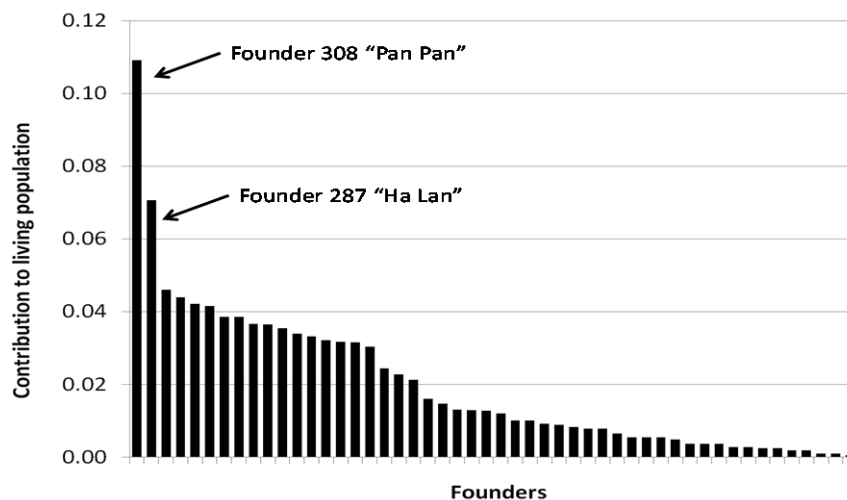

Figure 3. Genetic contribution of the 50 founders to the *ex situ* population gene pool. Each bar shows the contribution of a single founder. About 18% of the gene pool derives from only two founders (the left-most founders: 308 and 287).

Current inbreeding levels in the population are low, with only 5 inbred animals with inbreeding coefficients over 3%. While the current population is genetically healthy, pandas within institutions are closely related and it is becoming increasingly more difficult to identify non-related pairings within institutions. Inbreeding will increase as captive breeding increases and the influx of new founders from the wild remains proportionally low. This will be especially true for pairings within institutions, making the transfer of individuals among institutions for breeding more important in the future as a way to minimize inbreeding and the loss of gene diversity. In the near future, giant pandas, or their sperm, will need to be transferred among institutions to increase the number of genetically favorable breeding options in the primary breeding centers.

### **2012 Breeding Recommendations**

Since 2010, the focus on breeding has shifted from being concentrated on rapid demographic growth (high quantity breeding) to greater emphasis on genetic management (high quality breeding). There is less need for population growth, so fewer cubs will be needed, and more emphasis can be placed on breeding pairs with low MSI (Mate Suitability Index – see Appendix D) scores and individuals with low MK values to promote retention of gene diversity in the population. Greater emphasis can also be placed on breeding the 15 potential founders (wild-caught giant pandas) that have not yet reproduced as well as more genetically valuable (rare) family lines.

At the Changsha meeting, specific breeding recommendations were made for females at the Beijing Zoo, Chongqing Zoo, Chengdu Research Base, Louguanta, and Yaan Bifengxia Breeding Center. These recommendations are shown in the following table. The full MSI tables for all potential pairings are presented in Appendix D and can be used by other breeding institutions to determine best mates for their females, or evaluate the MSI scores of the pairs in their collection.

Priority was placed on breeding genetically valuable females (with low MK values) with genetically good males (low MSI scores for the pair). To improve genetic management some breeding age females were not recommended to breed in 2012; these were usually females of low genetic value to the population (have many relatives and are descendants of over-represented founders).

Female	Name	Location	MK	Recommended males to breed with

**APPENDIX A: Assumptions about breeding population for analysis.**

Data were taken from the 8 November 2011 version of the *International Giant Panda Studbook* compiled by Xie Zhong, CAZG, using the ISIS Single Population Analysis and Record Keeping System (SPARKS) v1.6 software program. SPARKS v1.6 and PMx v1.0 software (Ballou, Lacy and Pollak) were used to conduct both demographic and genetic analyses. Demographic characteristics of the population were analyzed for the period from 1 January 1990 to 8 November 2011. Genetic analysis was performed on the global living captive population. It is important to document the methods used in conducting the genetic analyses so that they can be repeated in future years.

This year 30 living pandas were excluded from the genetic analysis due to old age or chronic poor health and are listed in the table below. These pandas were excluded because they are not considered to be able to breed in the future and therefore can no longer contribute to the genetic diversity of the captive population. This left 303 pandas in the genetic population analysis.

<b>Stbk #</b>	<b>Location</b>	<b>Sex</b>	<b>Age</b>	<b>Reason excluded</b>
203	FUCHOW	Female	35	Too old
208	BERLINZOO	Male	33	Too old
230	ABERDE HK	Female	33	Too old
247	BEIJING	Female	29	Too old
253	CHONGQING	Female	29	Too old

418	YAAN BC	Female	23	Too old
444	LOUGUANTA	Female	23	Too old
497	LOUGUANTA	Female	15	Poor health

<b>Stbk #</b>	<b>Location</b>	<b>Sex</b>	<b>Age</b>	<b>Reason excluded</b>
498	FUCHOW	Female	27	Too old
500	LOUGUANTA	Female	26	Too old
524	HENGYANG	Male	11	Poor health
597	YAAN BC	Female	24	Too old
695	FUCHOW	Male	24	Too old

## **APPENDIX B: Giant pandas with uncertain paternity.**

### Assumptions about Paternity

Often in captivity female pandas are both naturally mated and artificially inseminated with two or more males to maximize the probability of conception. There are 60 pandas in the studbook with uncertain paternity and that are still living and/or have produced offspring (see table below; animals with uncertain paternity but that died young before they bred have been excluded). Many of these are recent births (born 2006 to 2011).

For animals with uncertain sires, all of the potential sires and the probability of each male being the true sire were entered into an analytical version of the studbook (named GP2011XX). The probability that a potential sire was the true sire were based on the following rules:

1. When a female was mated with multiple males using only one mating method – either only by natural matings (NM) or only by artificial inseminations (AI), equal probabilities were assigned to all potential sires.
2. When a female was mated using both NM and AI: In past cases, molecular genetic analyses showed that the male that was used for NM in almost all cases was the confirmed sire. Each sire mated by AI was given a 2% chance of being the true sire.
3. In cases of both NM and AI breeding methods, all males within the same method were given the same probability of being the true sire.
4. The sum of all probabilities for all potential sires for an animal = 100%.
5. For 10 animals that were born before 2002 when the first population analysis was conducted, there is no information available on mating method (NM or AI), but a male was selected as the sire. For these animals, this sire was kept for analysis.

Examples:

- A:** ♂ 201 (AI) and ♂ 202 (AI)  
201 = 50%; 202 = 50%
- B:** ♂ 174 (NM) and ♂ 201 (AI)  
174 = 98%; 201 = 2%
- C:** ♂ 201 (AI), ♂ 202 (AI) and ♂ 174 (NM)  
201 = 2%; 202 = 2%; 174 = 96%
- D:** ♂ 174 (NM), ♂ 424 (NM) and ♂ 201 (AI)  
174 = 49%; 424 = 49%; 201 = 2%

**It will be important to resolve these and any future uncertain paternities to accurately evaluate the genetic value of individuals, the relationship between mates, and the status of the population as a whole.**

<b>Stdbk#</b>	<b>Possible sires</b>	<b>Confirmed by molecular genetic analysis?</b>	<b>Relevant notes from 2011 studbook</b>	<b>Sires used in GP2011XX</b>
237	150, 186 (?)	No	No note of NM or AI; studbook entered 186 as the sire	186 <sup>1</sup>
278	174, 201 (?)	2001 analysis excluded 202 as possible sire	1991 note says may be 174, 201 or 202; 174 was entered as the sire. No note on which NM or AI.	174 <sup>1</sup>
297	174 (NM), 201 (AI?), 202 (AI?)	No		174 (96%); 201 (2%); 202 (2%)
314	174, 201, 202 (?)	No	1991 note used 201 but says may be any of these. No note if NM or AI.	201 <sup>1</sup>
320	119, 135, 149 (?)	No	1991 note says sire may also be 135 or 109, but 149 listed as sire.	149 <sup>1</sup>
323	150, 186 (?)	No	Note just says sire may be 150 or 186. 186 listed as the sire.	186 <sup>1</sup>
433	308 (NM); 298 (?)	Sire unresolved by 2001 analysis	No note about 298. 308 listed as the sire.	308 <sup>1</sup>
437	308 (NM); 298 (?)	Sire unresolved by 2001 analysis	No note about 298. 308 listed as the sire.	308 <sup>1</sup>
439	308, 329 (NM); 298 (?)	No	Note says 298 AI	308 (49%); 329 (49%); 298 (2%)
455	308, 329 (NM)	Molecular analyses, but unresolved		308 (50%); 329 (50%)
469	323, 369 (?)	No	1999 studbook had 323, no notes about any AI.	323 <sup>1</sup>
495	308, 329 (?)	Confirmed 2001	329 in 2001 genetic analyses, but twin showed 308	329
507	345, 369 (?)	No	1999 studbook had 369	369 <sup>1</sup>
532	377, 394, 399 (?)	No	No comments or mention of multiple sires as AI. 394 listed as sire.	394 <sup>1</sup>
538	308, 357 (?)	No	Sire 308 in 2001 studbook with 357 as AI	308 (98%); 357 (2%)
539	308, 357 (?)	No	Sire 308 in 2001 studbook with 357 as AI	308 (98%); 357 (2%)
547	308, 394 (NM); 357 (AI)	No		308 (49%); 394 (49%); 357 (2%)

<sup>1</sup> Male was listed as the sire in earlier versions of the studbook; however, there is no note on how the male was confirmed as the sire.

### APPENDIX C: Ranked mean kinship (MK) list for giant panda captive population.

Individual giant pandas are listed in order of genetic value for breeding (males on the left; females on the right; unsexed wild-caught pandas on both lists, in *italics*). Individuals at the top of the list have small mean kinship (MK) values because their genetic lines are under-represented and therefore are valuable breeders. Individuals with high MK values near the bottom of the list are over-represented in the population. The line in the middle of the list represents the average MK value for the population (0.0274); individuals above this line are underrepresented and are priority breeders to increase gene diversity in the population.

**APPENDIX D: Giant panda MSI values for mate selection during the 2012 breeding season (distributed at the meeting in Changsha in November 2011).**

Although females were assigned male mates during the Changsha meeting, there are always circumstances where identified males may not be available. In that case, we are providing the full MSI table to all institutions so they can, if needed, find other suitable mates if the ones identified are not available. When choosing males, consider the following:

- There is no need to attempt to breed all females; breeding efforts should concentrate on genetically valuable females.
- Pairs with MSI = 1 to 3 should be given breeding priority, especially for institutions with pairing choices, as this will improve genetic diversity and reduce inbreeding.
- Efforts should be made also to breed males and females with low mean kinship (MK) values. The average MK in the population is 0.0274. Animals with MK less than 0.0274 should be preferred breeders to maintain genetic diversity. The MK values are shown for each male and female on the MSI tables.
- Efforts should be made to breed any wild-acquired pandas that have not produced surviving offspring.
- AI should be restricted for use only for genetically valuable pairings that must be bred.

## MateRx listings

We are now using a rating system that calculates an index that indicates how good (or bad) any pair in a population is relative to several measures of genetic importance. The PMx software includes the MateRx tool, which is designed and developed to be a genetic tool that will guide population management decisions. For every male/female pair in the population, MateRx calculates a single numeric index indicating the relative genetic benefit or detriment to the population of breeding that particular pair. This index, called the mate suitability index (or MSI), is calculated from considering each pair's mean kinship values, the difference in the male's and female's mean kinship, the inbreeding coefficient of the offspring produced, and the amount of unknown ancestry in the pair. MateRx is designed to simplify the decisions about which pairs should be bred by condensing all that we know about the genetics of a pair into a single number.

MSI values are labeled as beneficial (scores = 1, 2, or 3) or detrimental (scores = 4, 5, or 6) to the population. Beneficial MSIs denote no detrimental effects relative to the genetic values of that pair, and MSI values of 4, 5, or 6 indicate at least one detrimental effect.

### MSI Score Definitions:

---

1 = very beneficial pair;  
2 = moderately beneficial pair;  
3 = slightly beneficial pair;

---

4 = slightly detrimental pair;  
5 = detrimental pair, should only be used if demographically necessary;  
6 = very detrimental pair, (should only be used if demographic considerations override preservation of genetic diversity per se).

---

“-“ = so detrimental that the pair should never be bred

- Breeding by MSI values does not address demographics, behavior or logistics of a pairing.
- MSI values are not intended for use with all captive managed species. Many species have unusual population histories and structures that require the expertise and attention of a trained population biologist. These populations may have characteristics such as few founders, many captive generations, extremely small numbers, or many unknown origins or parentage data that prohibit generic management.
- MSI values (and MK values) are time sensitive: the MSI rankings are only valid as long as there are no substantial changes in the population. These MSI tables should be considered invalid after one year following its date of creation.
